

System Framework & Deployment

Technical guide for implementing the NEXUS structural web environment.

01. Modular Architecture

NEXUS relies on a strict, component-driven SCSS architecture. The layout features an asymmetric vertical navigation spine and kinetic interaction modules. To maintain layout integrity, modify styles strictly within their corresponding partials.

```
/nexus-root
├── /assets
│   ├── /img           // Dedicated local image repository
│   ├── /js
│   │   └── main.js     // Kinetic interactions & theme controllers
│   ├── /scss
│   │   ├── _variables.scss // Global color & typography tokens
│   │   ├── _header.scss   // Vertical spine & navigation styles
│   │   └── main.scss      // Central compilation stylesheet
│   └── /css
│       └── main.css       // Compiled production stylesheet
└── index.html           // Primary structural markup
```

02. Monolithic Theming (Light / Dark)

The template incorporates a minimalist toggle within the navigation spine that alters the spatial atmosphere of the environment. This dynamic shifting is managed by overriding CSS custom properties applied at the root level.

To customize the tonal palette of either environment, modify the variable definitions located in `_variables.scss`:

- `:root` defines the default limestone/off-white aesthetic.

- `[data-theme="dark"]` controls the deep, low-light architectural atmosphere.

03. Media Asset Integration

By default, high-resolution architectural placeholder visuals are loaded via external CDNs to optimize initial archive distribution. The `assets/img/` directory is intentionally provided empty for your proprietary media.

Asset Implementation Protocol

To integrate your local portfolio photography, populate the `assets/img/` directory with web-optimized formats (`.webp`, `.jpg`). Subsequently, locate the corresponding target selectors within `index.html` (e.g., gallery grids or interactive feature cards) and update the `src` attributes to reference your local paths.
